Commercial Application of EGR Systems on Diesel Engines .. In experimental work intended to isolate the dilution effect, it is necessary to use an inert diluent.

Cylinder-to-cylinder EGR distribution is a very important factor in designing EGR systems. This aspect is especially challenging when working with limited space. The Exhaust Gas Recirculation (EGR) system's purpose is to reduce NO<sub>x</sub> . Pinging (spark knock or detonation) because the EGR system is not working, the .

temperature. Regulating the flow of exhaust gas is the job of the EGR system. This kept the EGR valve from opening when the engine was too cool. The cool . What is an Exhaust Gas Recirculation (EGR) system and how it work works. The EGR valve delivers a controlled reduction of oxygen content to the combustion Most older EGR systems use a vacuum regulated EGR valve while newer. EGR stands for Exhaust Gas Recirculation, Nitrogen oxide (NO<sub>x</sub>) emissions can be reduced Regulating the flow of exhaust gas is the job of the EGR system.

Exhaust Gas Recirculation (EGR) and NO<sub>x</sub> measurement The recirculated gas is normally introduced into the intake system before the intakes divide in a. The logic behind the EGR system is very simple. The exhaust gas is hotter than the fresh air sucked by the engine. So, the exhaust gas significantly reduces the.

field of EGR and diesel combustion and presenting the methods used in this work . Two papers are appended that treat different EGR-systems in more detail.
